Example: Solving a Classic Problem Using Walter Savitch's Method Let's walk through an example: Finding the sum of all nodes in a binary tree.

Problem Statement: Given a binary tree, compute the total sum of all its nodes.

Step-by-step solution:

Understanding the Problem

Input: Binary tree with integer values.

Output: Sum of all node values.

Constraints: Tree can be empty.

Edge cases: Tree with only one node, or skewed trees.

Planning the Approach Use recursion to traverse nodes. For each node, sum its value with the sums of its left and right subtrees.

Developing the Algorithm (Pseudocode):

```
function sumTree(node):
    if node is null:
        return 0
    leftSum = sumTree(node.left)
    rightSum = sumTree(node.right)
    return node.value + leftSum + rightSum
```

Implementation:

```
python
def sum_tree(node):
    if node is None:
        return 0
    return node.value + sum_tree(node.left) + sum_tree(node.right)
```

Testing: Empty tree: should return 0. Single node with value 5: should return 5. Tree with multiple nodes: verify the sum matches expected.

Analysis: Time complexity: $O(n)$, where n is the number of nodes. Space complexity: $O(h)$, where h is the height of the tree (due to recursion stack).
