Answer Key Highlights for Chem Lab Experiment 9

Common Questions and Solutions

Below are some typical questions found in the answer key for Experiment 9, along with summarized solutions:

How do you determine the endpoint in an acid-base titration? The endpoint is identified by a color change of the indicator (e.g., phenolphthalein turns from colorless to faint pink). Precise observation and consistent technique are essential to avoid overshooting.

How is the molarity of an unknown solution calculated? Using the titration data: $M_1V_1 = M_2V_2$, where M and V are molarity and volume of the known and unknown solutions. Rearranged to find M_2 (unknown molarity).

What are common sources of error in titration experiments? Inaccurate reading of burette, poor endpoint detection, contamination of solutions, or not mixing thoroughly.

How do you calculate percent purity or percent yield?

Percent purity = $(\text{mass of pure substance} / \text{total mass}) \times 100\%$

Percent yield = $(\text{experimental yield} / \text{theoretical yield}) \times 100\%$

Sample Calculations from the Answer Key

Titration Calculation Example

Given: 25.00 mL of unknown acid solution required 30.00 mL of 0.100 M NaOH

for neutralization. Calculation: $M_1V_1 = M_2V_2$ $M_{\text{unknown}} \times 25.00 \text{ mL} = 0.100 \text{ M} \times 30.00 \text{ mL}$
 $M_{\text{unknown}} = (0.100 \times 30.00) / 25.00 = 0.12 \text{ M}$
Percent Purity Calculation: If 0.50 g of compound is obtained from a sample weighing 0.55 g, then: Percent purity = $(0.50 / 0.55) \times 100\% = 90.91\%$
